FRG LITEPAPER

Forging the Future of Decentralized Capital

Ethereum Mainnet • Version 1.0

ForgeToken (FRG) smart contracts have completed structured internal audit review and adversarial red team test
ing prior to mainnet deployment. Testing results were documented during development and validated on testnet environments.

01 — Introduction

ForgeToken (FRG) is an Ethereum-based decentralized capital formation protocol designed to enable transparent, secure, and structured participation in early-stage digital asset ecosystems.

FRG begins with a public presale designed to bootstrap liquidity, align early participants, and establish the foundation for long-term ecosystem growth.

02 — Vision

ForgeToken aims to establish ForgeKingdom.io as a unified ecosystem for decentralized capital formation.

The long-term vision includes:
• A structured launch environment for new digital assets
• Transparent capital participation systems
• Community-aligned distribution mechanisms
• Expansion into a full decentralized launchpad

FRG serves as the core utility asset powering this ecosystem.

03 — Token Overview

Token Name: ForgeToken
Ticker: FRG
Network: Ethereum Mainnet
Standard: ERC-20
Total Supply: 10,000,000,000 FRG

The supply is fixed and designed to support both presale participation and post-launch liquidity.

04 — Token Allocation

6,000,000,000 FRG (60%) — Presale Allocation
4,000,000,000 FRG (40%) — Post-Presale Supply

Presale Allocation (6B FRG):
100% of the presale allocation is distributed according to the tokenomics presented on the official website.
All transactions are executed through the smart contract and are fully verifiable on-chain.

05 — Presale Structure

The presale is executed through a smart contract designed with:
• Transparent pricing logic
• Stage-based distribution
• Wallet tracking and limits
• On-chain verification

Participants interact directly with the contract without intermediaries.

06 — Post-Presale Supply

The remaining 4B FRG becomes available after presale completion and official token launch.

This supply supports:
• Market liquidity
• Ecosystem expansion
• Public participation beyond presale

07 — Security & Internal Audit

ForgeToken (FRG) smart contracts have completed:
• Structured internal audit review
• Adversarial red team testing
• Testnet validation

All testing was conducted prior to mainnet deployment.

08 — NFT Tier System

During the presale:
• Wallets are tracked on-chain
• Participation levels determine NFT tier eligibility

After presale completion:
• NFTs are distributed to eligible wallets
• These NFTs may provide future ecosystem benefits

09 — Roadmap

Phase 1 — Presale Launch
Smart contract deployment and public participation

Phase 2 — Presale Completion
Final allocations and NFT tier locking

Phase 3 — Token Activation
FRG becomes tradable

Phase 4 — Ecosystem Expansion
ForgeKingdom.io launchpad integration

10 — Risk Disclosure

Participation in cryptocurrency markets involves risk.
No guarantees are made regarding price performance or returns.

ForgeToken (FRG) smart contracts have completed structured internal audit review and adversarial red team test
ing prior to mainnet deployment. Testing results were documented during development and validated on testnet environments.
